

## CDF Online Monitoring

T. Arisawa, K. Ikado, K. Maeshima, H. Stadio,  
G. Veramendi, W. Wagner, H. Wenzel

- Goals
- Design
- Status

[http://www-  
b0.fnal.gov:8000/consumer/home/consumer\\_home.html](http://www-b0.fnal.gov:8000/consumer/home/consumer_home.html)

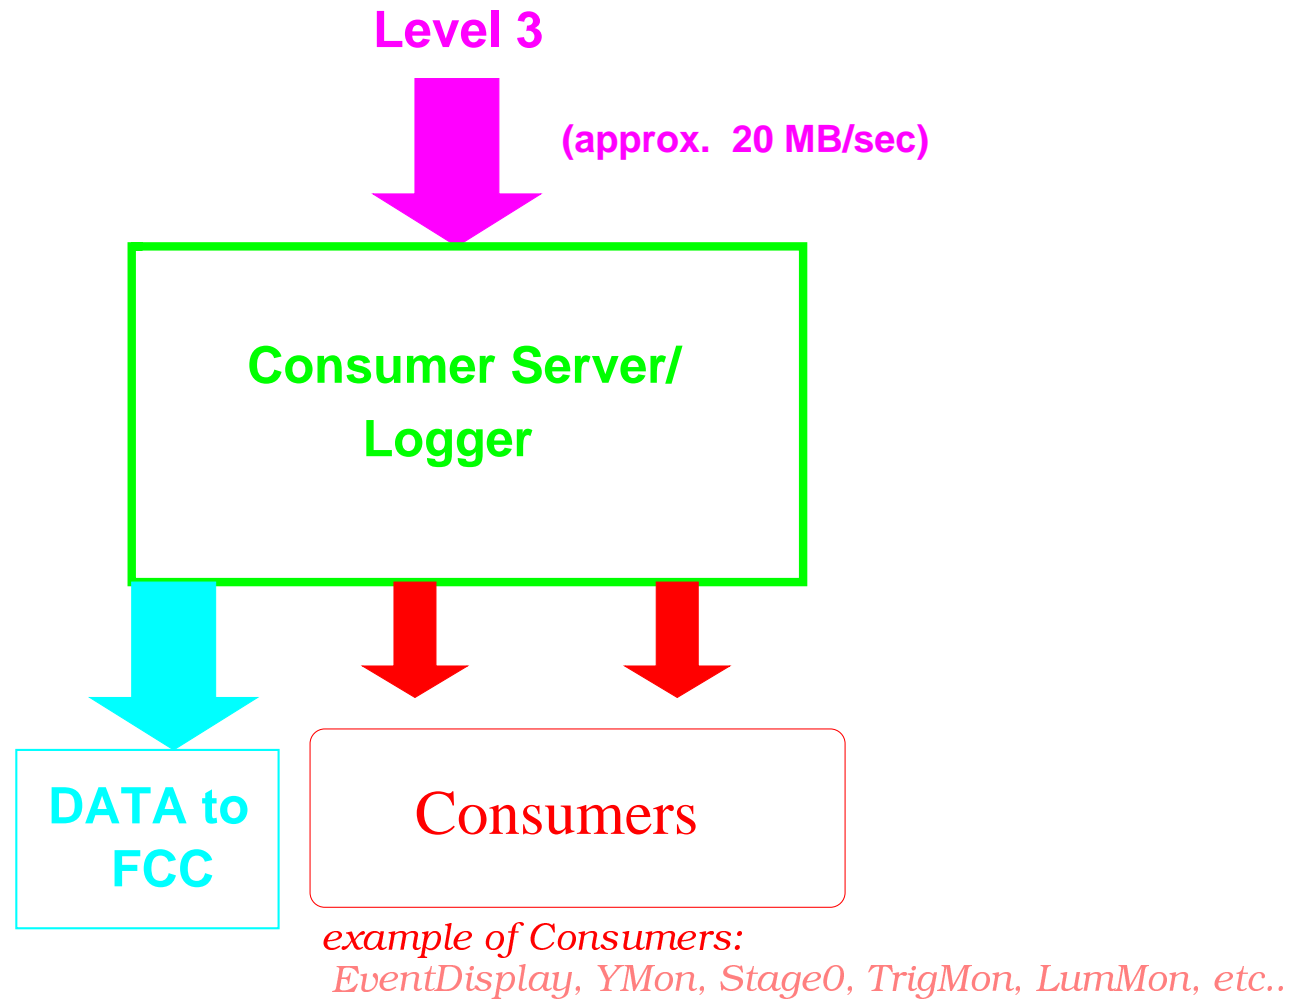

## Desired features of Consumer-Monitoring Framework

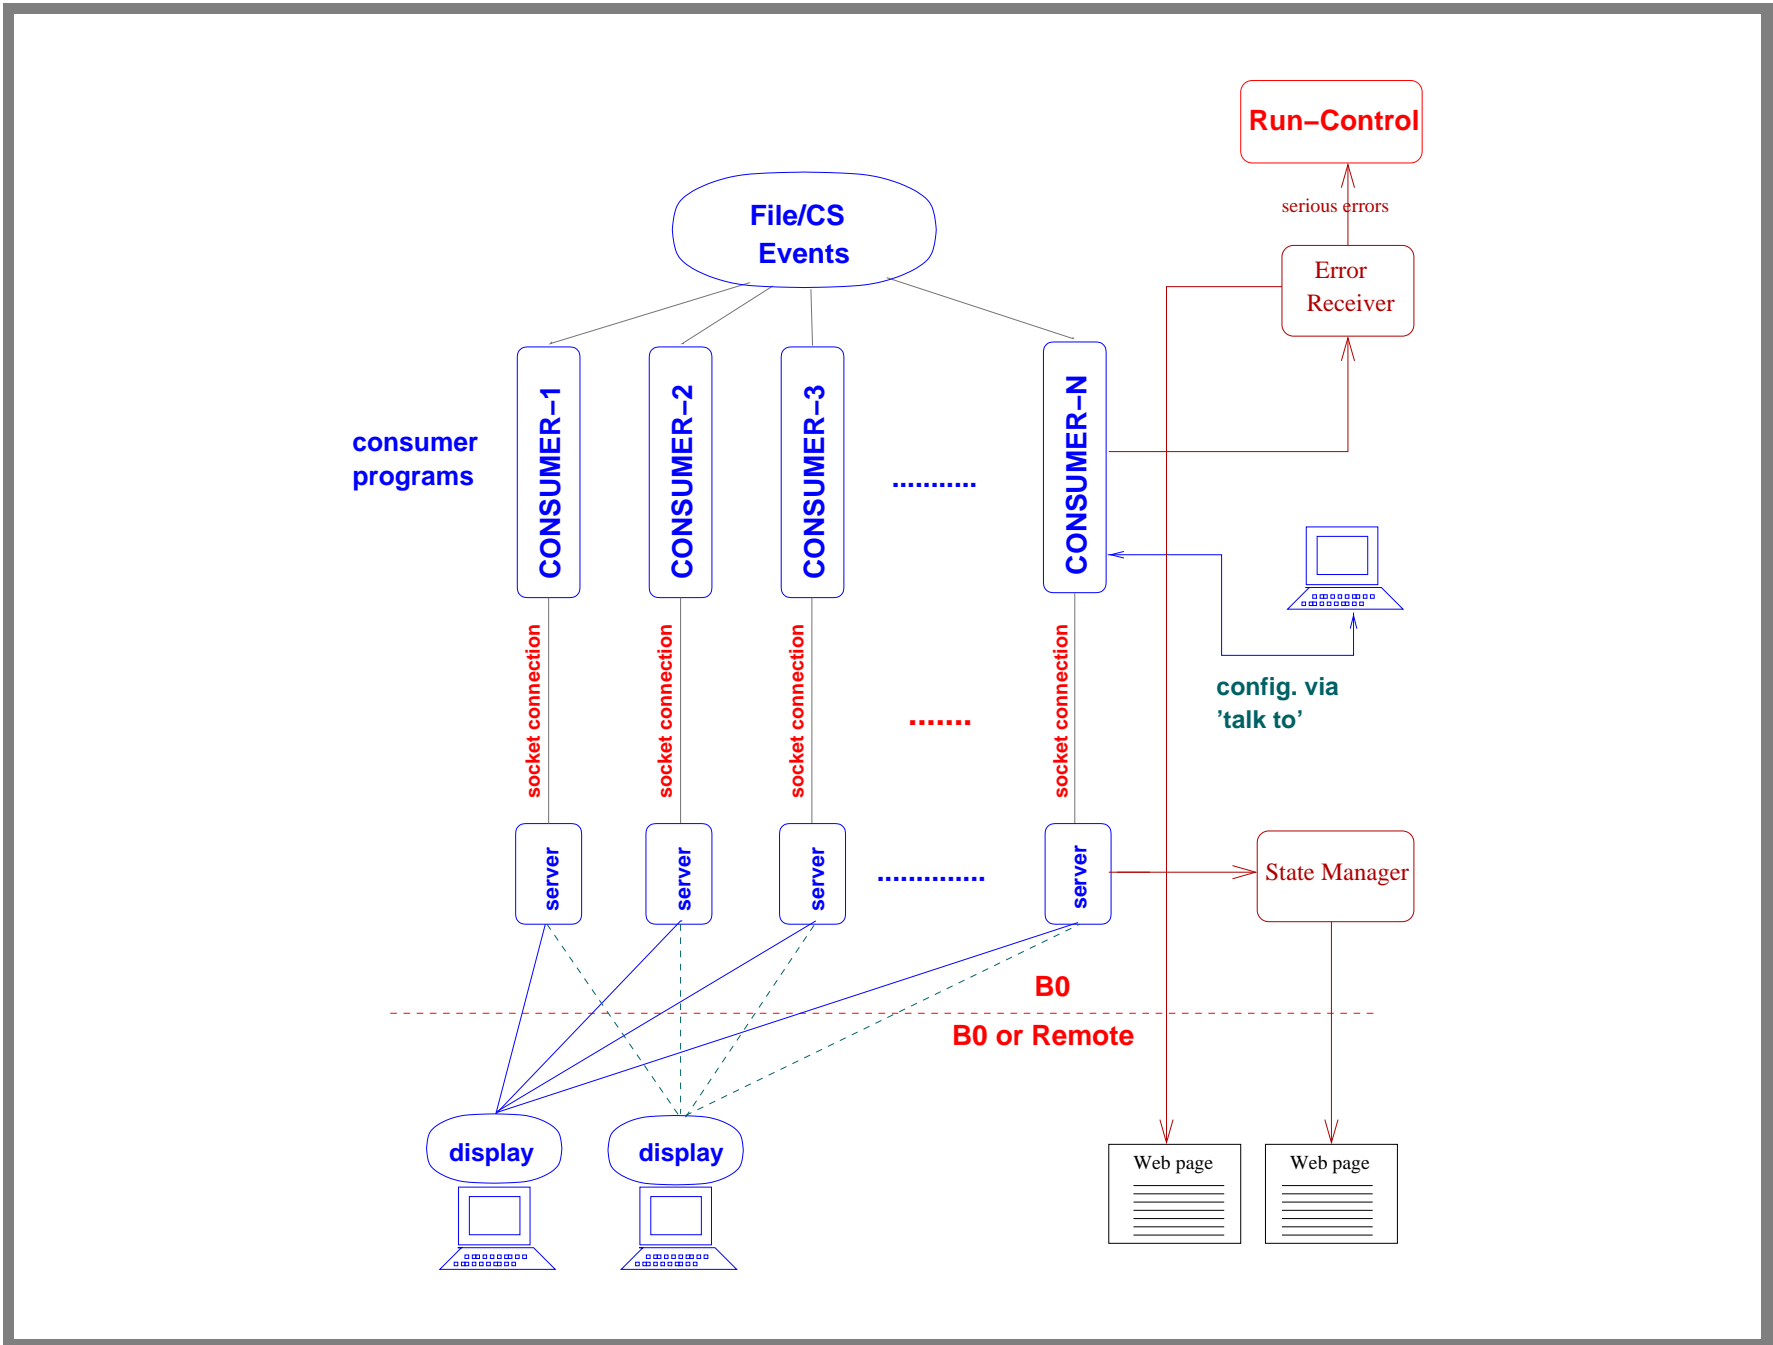

- monitor the detector without interfering with the data taking  
make occupancy plots, watch trigger (rates), check reconstruction objects, etc.
- different consumer processes can run on different machines
- each consumer receives only the data it needs
- the monitoring and the display processes are separated  
The number of displays is only limited by network traffic and bandwidth
- different consumers can be combined to one executable
- common interface and maintainability

## How do we get the data?

## I. The Consumers

- analyze and monitor the event data
- use CDF Run II offline framework to look at data
- consists of different AC++ modules:
  - APPConsumerInputModule
  - ConsumerErrorModule  
adds special destination to the ZOOM error logger to send errors to the ConsumerErrorReceiver
  - module inheriting from ConsumerFrameworkModule  
consists of different monitors that are written by the experts  
all these monitors inherit from BaseMonitor2  
starts server process at the beginning of a job

## BaseMonitor2

- base class for all monitors
- functions to be overwritten by the monitor writer:  
initialize(), reset(), addEvent(EventRecord\* event),  
checkMonitor(), finalFit(), summary(std::ostream &os=std::cout),  
store(TFile\* f)
- “framework” functions:  
addObject(TObject \*obj, const char \*const path),  
addSlideshowObject(TObject \*obj),  
addErrorObject(TObject \*obj, const char \*const text),  
createCanvas(const char \*const name, const char \*const title, int  
nx, int ny),  
removeObject(TObject \*obj)

## TConsumerInfo

- is sent from the consumer to server
- is sent from the server to the display
- contains information about the consumer
  - name
  - run number
  - number of events processed
  - list of all ROOT objects that are available (at the moment)

## II. The Server

- receives ROOT objects from the consumer via socket
- deals with requests from the displays
- reports the status of the consumer to the state manager
- TCanvas: stores message, not the object

## III. The Display

- ROOT-based GUI
- can connect to the server via socket, can browse TFile or TMapFile
- at first requests TConsumerInfo and creates a list tree
- only updates objects on canvas, does not redraw whole canvas

**Connection Status**

name	hostname	port	runn	events	status
YMon	b0dap30.fnal.gov	9091	103568	10	Running

**CHAD PMT Plots**

CHAD PMT Canvas; Run #103568      Fri Feb 16 09:57:30 2001

CHAD West LPMT Occupancy per event

CHAD East LPMT Occupancy per event

CHAD West RPMT Occupancy per event

CHAD East RPMT Occupancy per event

**CDF Consumer Display Main Frame**

**CDF Consumer Display**

Input Stream

- Memory Map File
- Other ROOT File
- Socket Connection

Name of File / Socket Server:Port

b0dap30:9091     

Consumer Name in "ConsumerInfo.txt" (Optional User Control)

- Automatical Update
- Update Multi Canvases

Update Delay (msec)

Histogram

# Example: BeamMon

## Status

- first full scale test in CDF commissioning runs last fall with four consumers
- framework implementation restructured during winter/spring
- Run II started ; framework in place ; eight consumers ;  
~ 20 monitor writers
- still adding more consumers and enhancing others during the commissioning of the detector
- cdfsoft-independent version of consumer framework available

## Comments & Problems with ROOT 2.26

- nice and easy to send objects via socket
- a lot of problems with TMapFile → do not use it any more
- scope rules with files , canvas
- problems with overdrawing contents on a canvas ; canvas design
- batch mode , gif-files (TCanvas::Print)

## Acknowledgements

We thank all the people who are contributing to this work. Special thanks to the ROOT team, the CDF online group, and the Fermilab Computing Division. We also thank the community of ROOT users who via the roottalk mailing list provide answers and solutions to many problems.
