

An **incomplete** view of the future of HEP  
Some things **like to** know for the future  
of HEP Computing

Matthias Kasemann  
Fermilab

## *Disclaimer*

Fermilab

Root2001

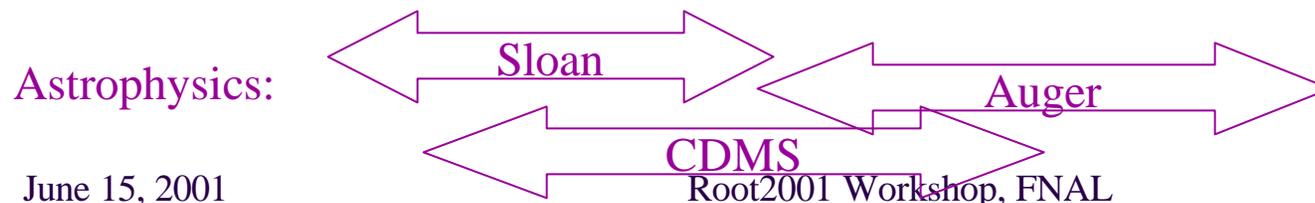

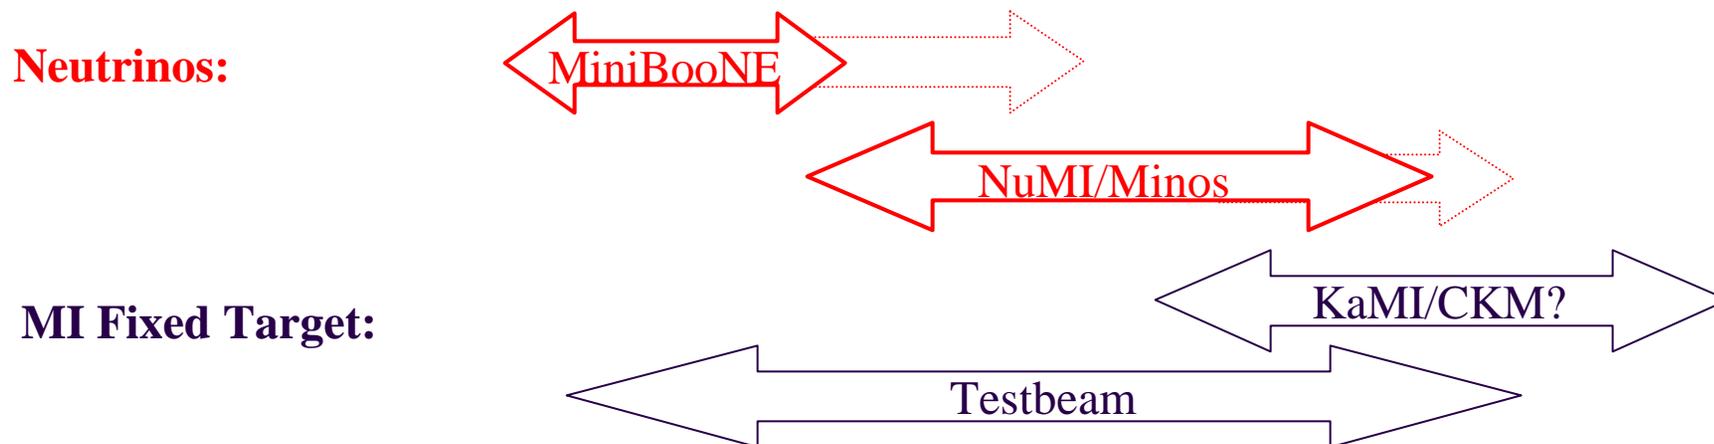

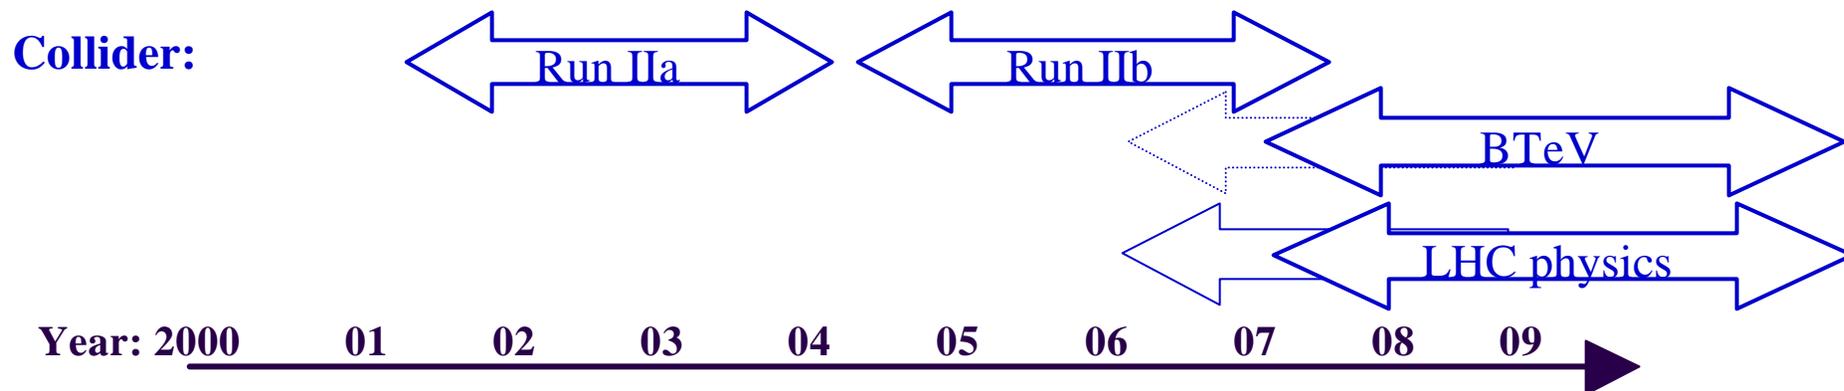

Although we are here in the Root workshop I don't present topics which are necessarily to be answered by Root in its current implementation or any derivative or future development in Root. I simply put down what worries me when I think about computing for future HEP experiments.

(Speaking for myself and not for US, US DOE, FNAL nor URA.) (Product, trade, or service marks herein belong to their respective owners.)

# Fermilab HEP Program

Root2001

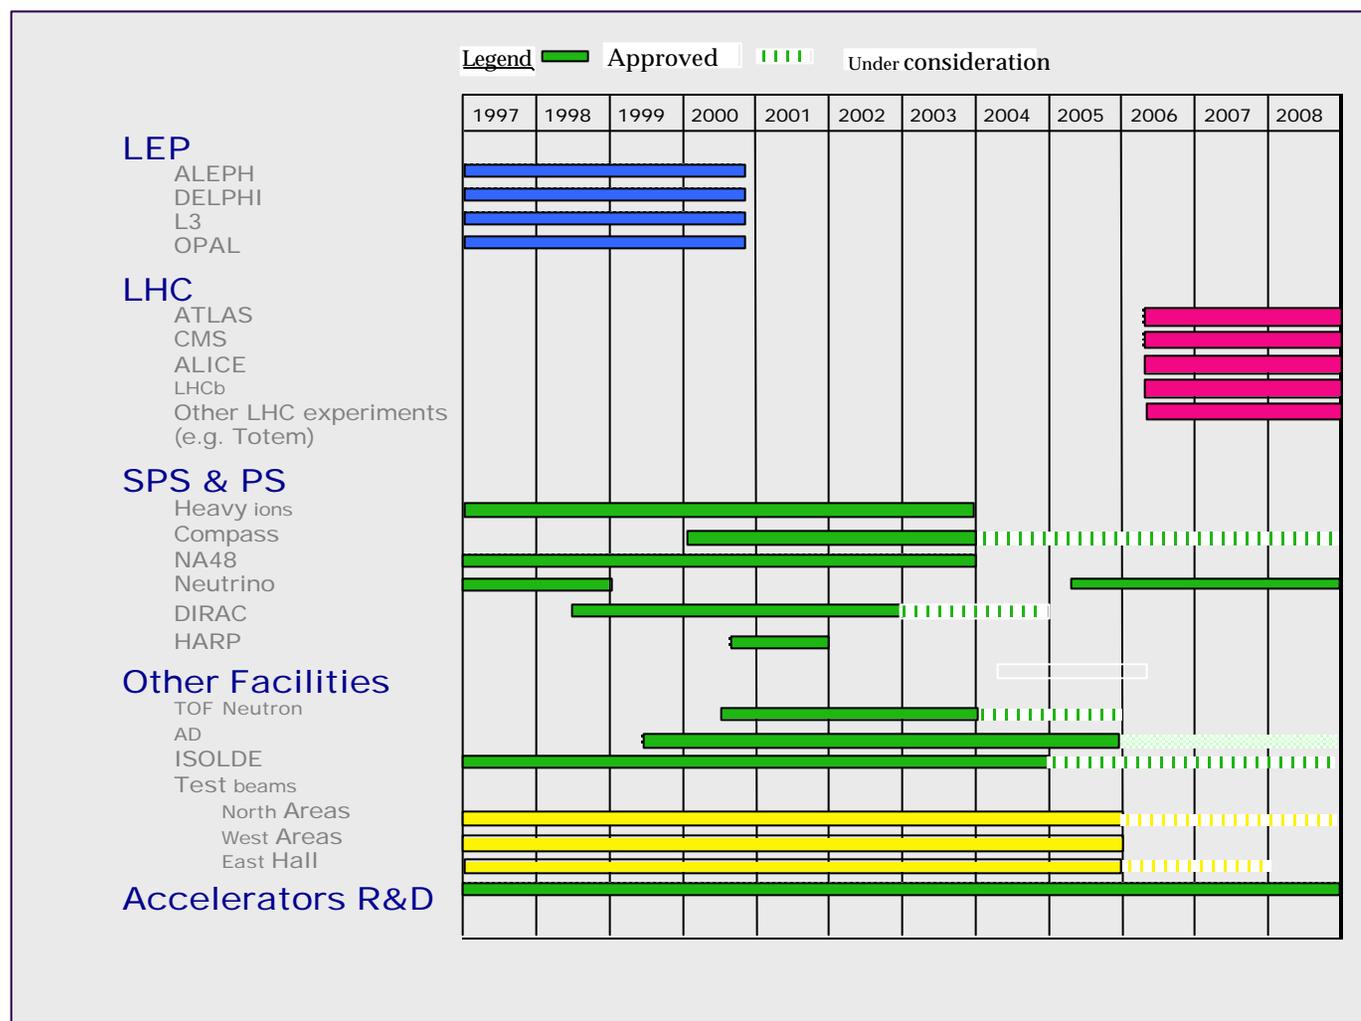

# The CERN Scientific Programme

Fermilab

Root2001

# HEP computing: The next 5 years...(1)

Fermilab  
Root2001

- ◆ Data analysis for completed experiments continues
  - ◆ Challenges:
    - ◆ No major change to analysis model, code or infrastructure
    - ◆ Operation, continuity, maintaining expertise and effort
  
- ◆ Data collection and analysis for ongoing experiments
  - ◆ Challenges:
    - ◆ Data volume, compute resources, software organization
    - ◆ Operation, continuity, maintaining expertise and effort

# HEP computing: The next 5 years...(2)

Fermilab  
Root2001

- ◆ Starting experiments:
  - ◆ Challenges:
    - ◆ Completion and verification of data and analysis model,
    - ◆ Data volume, compute resources, software organization, \$\$'s
    - ◆ Operation, continuity, maintaining expertise and effort
  
- ◆ Experiments in preparation:
  - ◆ Challenges:
    - ◆ Definition and implementation of data and analysis model,
    - ◆ data volume, compute resources, software organization, \$\$'s
    - ◆ continuity, getting and maintaining expertise and effort
    - ◆ Build for change: applications, data models...
    - ◆ Build compute models which are adaptable to different local environments

# Run 2 Data Volumes

Fermilab

Root2001

| Category            | Parameter          | D0          | CDF         |
|---------------------|--------------------|-------------|-------------|
| <b>DAQ rates</b>    | Peak rate          | 53 Hz       | 75 Hz       |
|                     | Avg. evt. Size     | 250 KB      | 250 KB      |
|                     | Level 2 output     | 1000 Hz     | 300 Hz      |
|                     | maximum log rate   | Scalable    | 80 BM/s     |
| <b>Data storage</b> | # of events        | 600M/year   | 900 M/year  |
|                     | RAW data           | 150 TB/year | 250 TB/year |
|                     | Reconstructed data | 75 TB/year  | 135 TB/year |

- ◆ First Run 2b costs estimates based on scaling arguments
  - ◆ Use predicted luminosity profile
  - ◆ Assume technology advance (Moore's law)
  - ◆ CPU and data storage requirements both scale with data volume stored
- ◆ Data volume depends on physics selection in trigger
  - ◆ Can vary between 1 – 8 PB (Run 2a: 1 PB) per experiment
- ◆ Have to start preparation by 2002/2003

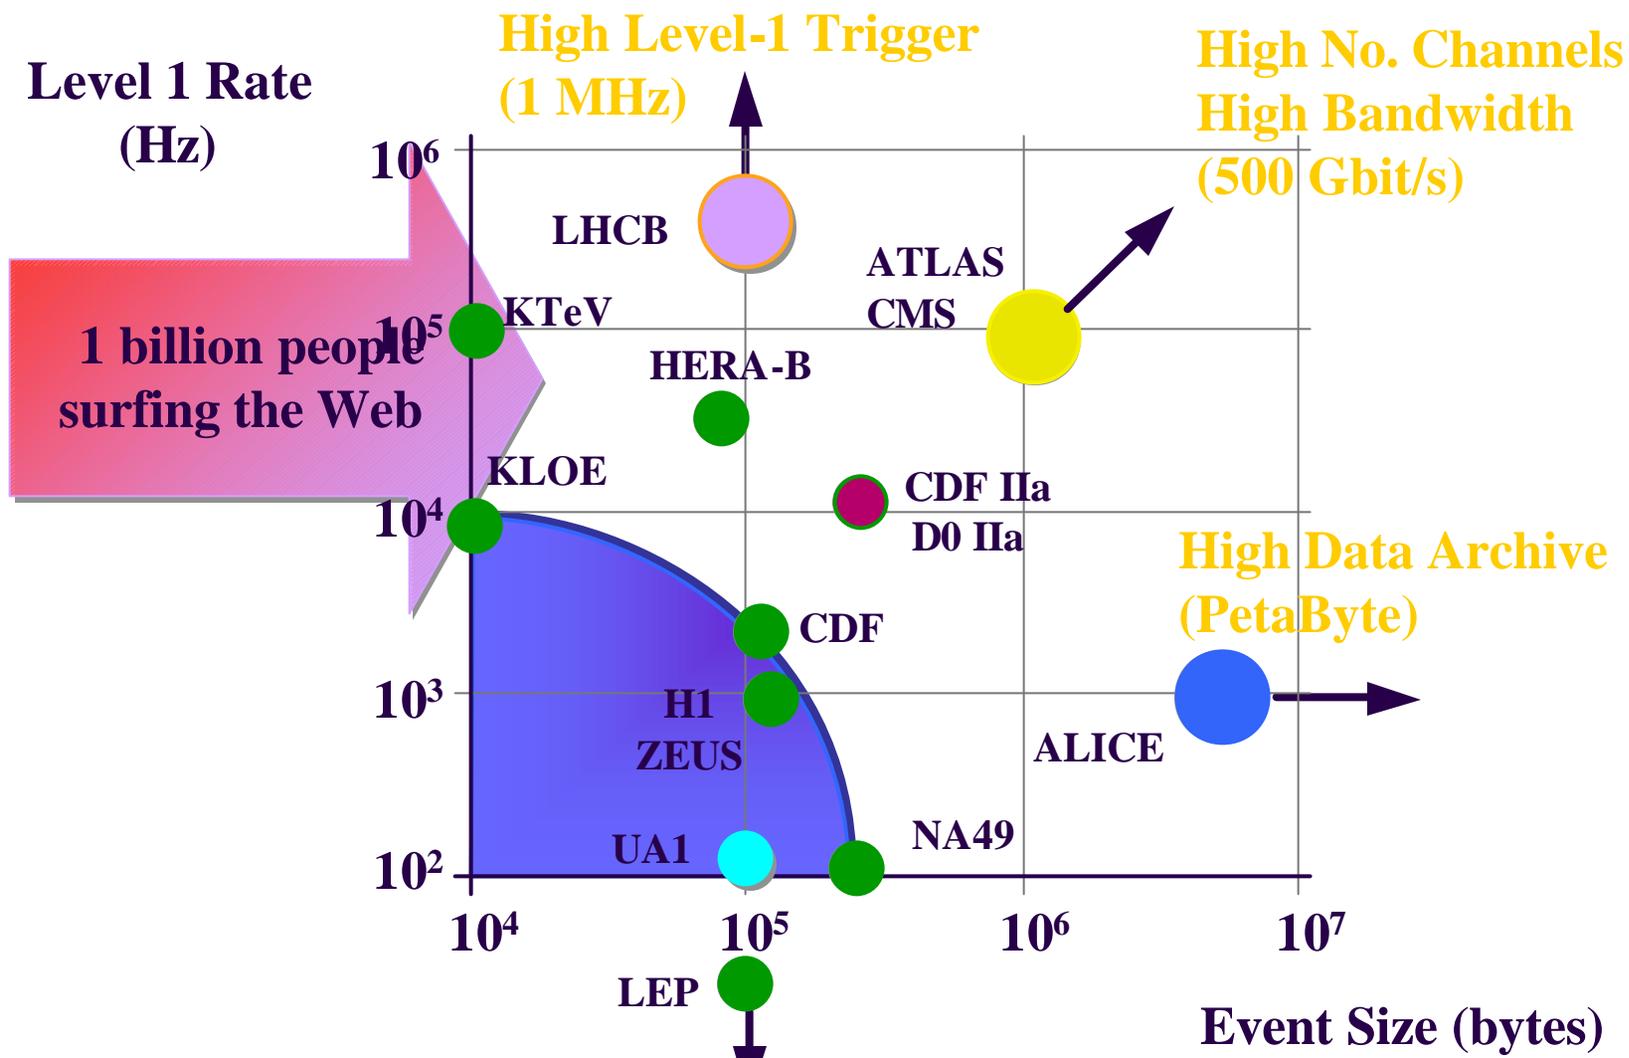

# How Much Data is Involved?

Fermilab

Root2001

# *HEP computing: The next 5 years...(3)*

---

Fermilab  
Root2001

- ◆ Challenges in big collaborations
  - ◆ Long and difficult planning process
  - ◆ More formal procedure required to commit resources
  - ◆ Long lifetime, need flexible solutions which allow for change
    - ◆ Any state of experiment longer than typical PhD or postdoc time
    - ◆ Need for professional IT participation and support
  
- ◆ Challenges in smaller collaborations
  - ◆ Limited in resources
  - ◆ Adapt and implement available solutions (“b-b-s”)

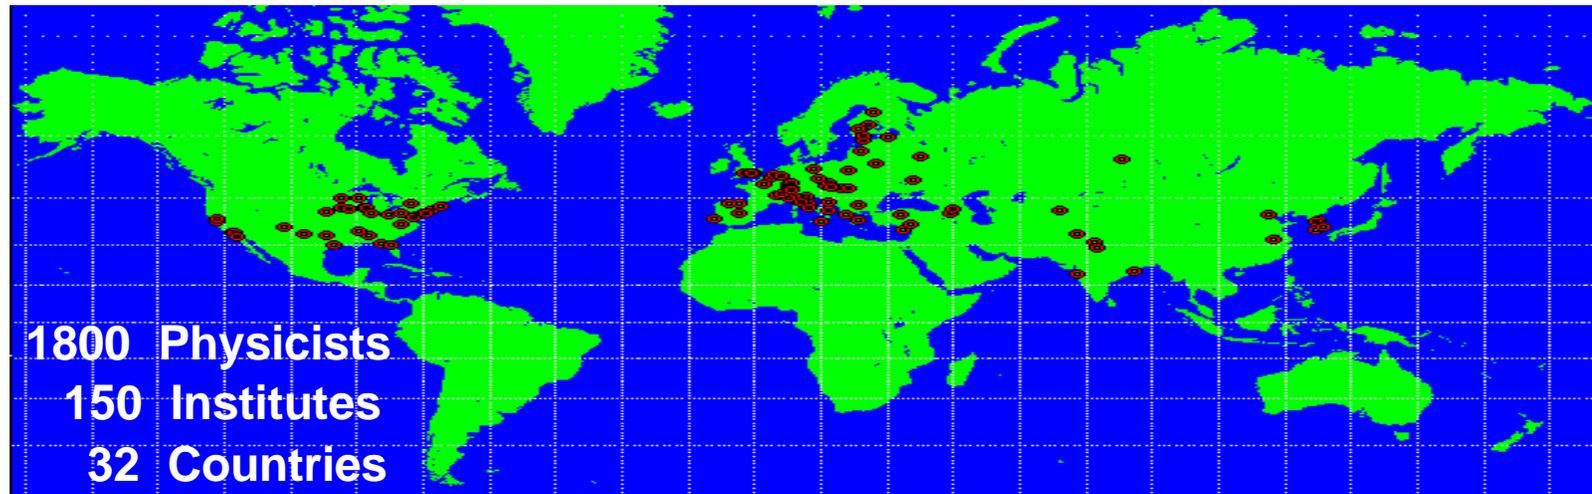

# CMS Computing Challenges

Fermilab

Root2001

- ◆ Experiment in preparation at CERN/Switzerland
- ◆ Strong US participation: ~20%
- ◆ Startup: by 2005/2006, will run for 15+ years

**Major challenges associated with:**  
**Communication and collaboration at a distance**  
**Distributed computing resources**  
**Remote software development and physics analysis**  
**R&D: New Forms of Distributed Systems**

## Role of computer networking (1)

Fermilab

Root2001

- ◆ State-of-the-art computer networking enables large international collaborations
  - ◆ needed for all aspects of collaborative work
    - ◆ to write the proposal,
    - ◆ produce and agree on the designs of the components and systems,
    - ◆ collaborate on overall planning and integration of the detector, confer on all aspects of the device, including the final physics results, and
    - ◆ provide information to collaborators and to the physics community and general public
  - ◆ Data from the experiment lives more-and-more on the network
    - ◆ All levels: raw, dst, aod, ntuple, draft-paper, paper

## Role of computer networking (2)

Fermilab

Root2001

- ◆ HEP developed its own national network in the early 1980s
- ◆ National research network backbones generally provide adequate support to HEP and other sciences.
- ◆ Specific network connections are used where HEP has found it necessary to support special capabilities that could not be supplied efficiently or capably enough through more general networks.
  - ◆ US-CERN, several HEP links in Europe...
- ◆ Dedicated HEP links are needed in special cases because
  - ◆ HEP requirements can be large and can overwhelm those of researchers in other fields
  - ◆ because regional networks do not give top priority to interregional connections

## *Data analysis in international collaborations: past*

---

Fermilab  
Root2001

- ◆ In the past analysis was centered at the experimental site
  - ◆ a few major external centers were used.
  - ◆ Up the mid 90s bulk data were transferred by shipping tapes, networks were used for programs and conditions data.
  - ◆ External analysis centers served the local/national users only.
  - ◆ Often staff (and equipment) from the external center being placed at the experimental site to ensure the flow of tapes.
  - ◆ The external analysis often was significantly disconnected from the collaboration mainstream.

# *Data analysis in international collaborations: truly distributed*

---

Fermilab  
Root2001

- ◆ Why?
  - ◆ For one experiment looking ahead for a few years only centralized resources may be most cost effective, but:
  - ◆ national and local interests leads to massive national and local investments
  - ◆ For BaBar:
    - ◆ The total annual value of foreign centers to the US-based program is greatly in excess of the estimated cost to the US of creating the required high-speed paths from SLAC to the landing points of lines WAN funded by foreign collaborators
  - ◆ Future world-scale experimental programs must be planned with explicit support for a collaborative environment that allows many nations to be full participants in the challenges of data analysis.

## *Distributed computing:*

Fermilab

Root2001

- ◆ Networking is an expensive resource, should be minimized
- ◆ Pre-emptive transfers can be used to improve responsiveness at the cost of some extra network traffic.
- ◆ Multi-tiered architecture must become more general and flexible
  - ◆ to accommodate the very large uncertainties in the relative costs of CPU, storage and networking
  - ◆ To enable physicists to work effectively in the face of data having unprecedented volume and complexity
- ◆ Aim for transparency and location independence of data access
  - ◆ the need for individual physicists to understand and manipulate all the underlying transport and task-management systems would be too complex

## Distributed Computing

Fermilab

Root2001

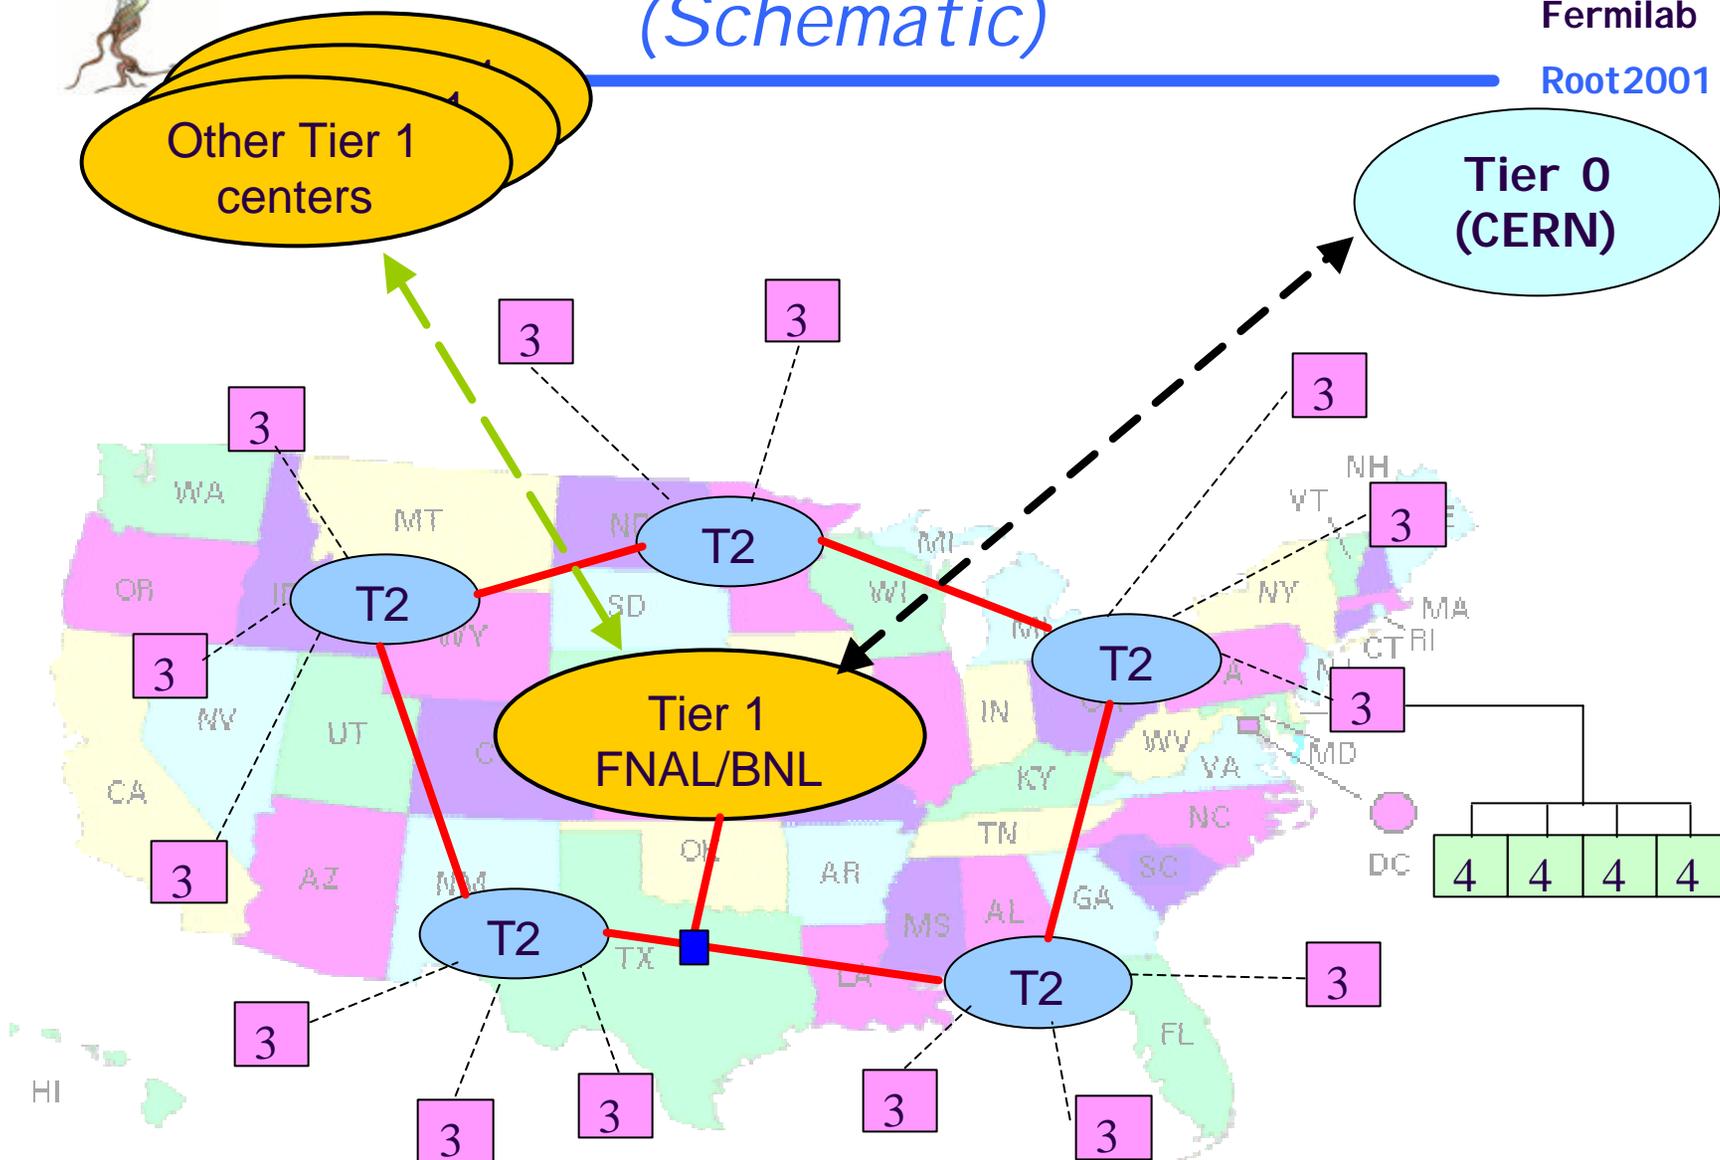

6/13/01: **The New York Times**  
ON THE WEB

"It turns out that distributed computing is really hard," said Eric Schmidt, the **chairman of Google**, the Internet search engine company.

"It's much harder than it looks. It has to work across different networks with different kinds of security, or otherwise it ends up being a single-vendor solution, which is not what the industry wants."

# LHC Data Grid Hierarchy (Schematic)

Fermilab  
Root2001

# *Many more technical questions to answer (1)*

---

Fermilab  
Root2001

- ◆ Operating system:
  - ◆ UNIX seems to be favored for data handling and analysis,
  - ◆ LINUX is most cost effective
- ◆ Mainframe vs. commodity computing:
  - ◆ commodity computing can provide many solutions
  - ◆ Only affordable solution for future requirements
  - ◆ How to operate several thousand nodes?
  - ◆ How to write applications to benefit from several thousand nodes?
- ◆ Data access and formats:
  - ◆ Metadata databases, event storage

## *Many more technical questions to answer (2)*

---

Fermilab  
Root2001

- ◆ Commercial vs. custom software, public domain
- ◆ Programming languages:
  - ◆ Compiled languages for CPU intensive parts
  - ◆ Scripting languages provide excellent frameworks
- ◆ How to handle and control big numbers in big detectors:
  - ◆ Number of channels, modules improves (several millions of channels, hundreds of modules)
  - ◆ Need new automatic tools to calibrate, monitor and align channels

## Some more thoughts

Fermilab  
Root2001

- ◆ Computing for HEP experiments is costly
    - ◆ In \$\$'s, people and time
    - ◆ Need R&D, prototyping and test-beds to develop solutions and validate choices
  
  - ◆ Improving the engineering aspect of computing for HEP experiments is essential
    - ◆ Treat computing and software as a project (see [www.pmi.org](http://www.pmi.org)):
      - ◆ Project lifecycles, milestones, resource estimates, reviews
  
  - ◆ Documenting conditions and work performed is essential for success
    - ◆ Track detector building for 20 years
    - ◆ Log data taking and processing conditions
    - ◆ Analysis steps, algorithms, cuts
- } As transparent and automatic as possible
